1. Introduction

This document specifies profiles **for establishing a parallel Post Quantum Cryptography (PQC) PKI in the Community Interoperability Test Environment (CITE)**. These profiles are for CITE PQC Test certificates and CRLs, using the ML-DSA and ML-KEM quantum resistant algorithms, issued under the *X.509 Certificate Policy for the U.S. Federal PKI Common Policy Framework* [COMMON] and that have a trust path to the PQC Test Federal Common Policy CA operated by the Federal PKI Management Authority. Use of these profiles and test certificates will initially be for the FPKI community to assist in determining appropriate PQC keys and algorithms and moving forward will also be for use in updating relevant FPKI policies and documents.

Requirements are included in five sections of this document:

- Section 2: X.509 v3 Certificates
- Section 3: X.509 v2 Certificate Revocation Lists
- Section 4: Encoding of Relative Distinguished Names
- Section 5: Use of URIs
- Section 6: Profile Worksheets

The purpose of these profiles is to maintain consistency and interoperability across the Federal PKI for cross-agency use.

2. X.509 v3 Certificates

X.509 v3 certificates contain the identity and attribute data of the certificate subject in the base certificate fields and certificate extensions. Detailed information about X.509 certificates can be found in [X.509] and [RFC 5280].

The base certificate fields identify the issuer (i.e., CA), subject, version number, subject's public key, validity period, and serial number of the certificate along with the public key algorithm used to digitally sign the certificate. Certificate extensions contain additional information about the subject or the CA.

Each of the certificate profile worksheets in Section 6 list mandatory contents of a particular class of certificates. Optional features that are supported in Federal PKI are also identified. These features may be included at the discretion of the certificate issuer.

Standard certificate extensions are defined in [X.509]. For each profile worksheet, any standard extensions that are not specified as mandatory or optional must not be included.

Certificate issuers may include additional information in non-critical private certificate extensions for local use, but should not expect clients in the Federal PKI to process this additional information. Critical certificate extensions that are not listed in these profile worksheets must not be included.

3. X.509 v2 Certificate Revocation Lists

X.509 v2 certificate revocation lists identify the issuer CA, the date the CRL was generated, the date by which the next CRL must be generated, and the list of revoked

certificates.

The Certificate Revocation List worksheet in Section 6 lists mandatory contents of CRLs. Optional features that are supported in the Federal PKI are also identified. These features may be included at the discretion of the certificate issuer.

Standard CRL extensions are defined in [X.509]. For the CRL worksheet, any standard extensions that are not specified as mandatory or optional must not be included.

Certificate issuers may include additional information in non-critical private CRL extensions for local use, but should not expect clients in the Federal PKI to process this additional information. Critical CRL extensions that are not listed in the CRL worksheet must not be included in the CRLs issued.

CRLs must be stored as HTTP accessible files and may be stored as attributes in a directory.

CRLs must comply with the requirements of Section 4.9.7 of [COMMON] and must be full and complete as described in [RFC 5280], these CRLs must not be indirect CRLs, delta-CRLs, or CRLs partitioned by reason code.

CAs may optionally issue additional CRLs, such as CRLs partitioned by a value other than reason code or delta-CRLs.

If delta-CRLs are issued, then either the certificates or the full CRLs that correspond to the delta-CRLs should include a FreshestCRL extension that points to the delta-CRLs.

4. Encoding of Relative Distinguished Names

Certificates must use either PrintableString or UTF8String for all DirectoryString Relative Distinguished Names.

The issuer field of certificates and CRLs should be encoded exactly as it is encoded in the subject name of the signing CA certificate to avoid complications associated with name chaining and name constraints computation. Commonly used certificate path validation implementations may be unable to perform name comparisons when names are encoded using different character sets. CAs are strongly encouraged to use consistent encoding of identical distinguished name components within a hierarchy.

CAs should use consistent encoding of name constraints and all constrained name components within the certification path. Name constraints specified in CA certificates must be compared with the subject names in subsequent certificates in a certification path, to ensure they are applied correctly.

5. Subject Public Key Information (SPKI)

Algorithms Supported

These CITE Test Profiles use ML-DSA [FIPS204] for digital signature and authentication and ML-KEM [FIPS203] for key encapsulation.

Only the “pure” ML-DSA scheme is used. “Pre-hash” ML-DSA is not currently specified for use. Where pre-hashing functionality is required, the “external mu” approach described in the following clarification to FIPS 204 should be used:

<https://csrc.nist.gov/csrc/media/Projects/post-quantum-cryptography/documents/faq/fips204-sec6-03192025.pdf>

5.1. Authentication and/or Signature Certificate

All signature and/or authentication certificates shall contain one of the following OIDs in the SPKI:

id-ml-dsa-87 OBJECT IDENTIFIER ::= {2.16.840.1.101.3.4.3.19}
id-ml-dsa-65 OBJECT IDENTIFIER ::= {2.16.840.1.101.3.4.3.18}
id-ml-dsa-44 OBJECT IDENTIFIER ::= {2.16.840.1.101.3.4.3.17}

Parameters field shall be absent. The subject public key shall contain the byte values listed in Section 7.2, Algorithm 22 [FIPS204]; the byte values shall be raw (i.e., not ASN.1 encoded) prior to encoding as a BIT STRING.

5.2. Key Encapsulation Certificate

All key encapsulation certificates, commonly referred to as encryption certificates, shall contain one of the following OIDs in the SPKI:

id-alg-ml-kem-1024 OBJECT IDENTIFIER ::= {2.16.840.1.101.3.4.4.3}
id-alg-ml-kem-768 OBJECT IDENTIFIER ::= {2.16.840.1.101.3.4.4.2}
id-alg-ml-kem-512 OBJECT IDENTIFIER ::= {2.16.840.1.101.3.4.4.1}

Parameters field shall be absent. The subject public key shall contain the byte values listed in Section 5.1, Algorithm 13, Step 19 [FIPS203]; the byte values shall be raw (i.e., not ASN.1 encoded) prior to encoding as a BIT STRING.

5.3. Signature Algorithm OIDs

A certificate or CRL shall contain one of the following values for the signature algorithm OID:

id-ml-dsa-87 OBJECT IDENTIFIER ::= {2.16.840.1.101.3.4.3.19}
id-ml-dsa-65 OBJECT IDENTIFIER ::= {2.16.840.1.101.3.4.3.18}
id-ml-dsa-44 OBJECT IDENTIFIER ::= {2.16.840.1.101.3.4.3.17}

Parameters field shall be absent. Actual signature shall be encoded as BIT STRING and shall contain the byte values listed in Section 7.2, Algorithm 26 in [FIPS204]. The “context string” value used when generating or verifying an ml-dsa signature on certificates and CRLs is the empty string.

6. Use of URIs

Uniform Resource Identifiers (URIs) are found in three different extensions within the certificate profiles:

- cRLDistributionPoints
- authorityInfoAccess
- subjectInfoAccess

Each of these extensions must include an HTTP URI. If an LDAP URI is included, it must appear after the HTTP URI.

For all URIs:

- The scheme portion of all URIs must be either "http" or "ldap".
- The hostname must be specified as a fully qualified domain name.
- The default port for the relevant protocol (80 for HTTP and 389 for LDAP) must be used, but need not be included in the URI.

6.1. CRL Distribution Points Extension

This section includes requirements in addition to those specified in Section 2.2.1 in [COMMON].

At least one HTTP URI is required and:

- Must return a file that contains the latest DER encoded full and complete CRL, with a file extension of ".crl".
- Must include "Content-Type: application/pkix-crl" in the HTTP response headers.

If the DistributionPointName is present in the issuingDistributionPoint extension of the CRL, the value must match at least one DistributionPointName in the cRLDistributionPoints extensions in each of the certificates covered by the CRL.

An LDAP URI may be included in the cRLDistributionPoints extension. If present, the LDAP URI must include the DN of the entry containing the CRL and specify the directory attribute in which the CRL is located (certificateRevocationList, authorityRevocationList, or deltaRevocationList).

6.2. Authority Information Access Extension

This section includes requirements in addition to those specified in Section 2.2.1 in [COMMON].

The HTTP URI in the authorityInfoAccess extension must contain at least one instance of the id-ad-caIssuers access method containing a publicly accessible HTTP URI which returns a certs-only Cryptographic Message [RFC 8551]. This message:

- Must contain a binary (DER encoded) file with an extension of ".p7c".
- Must include "Content-Type: application/pkcs7-mime" in the HTTP response

headers.

- Must not contain any self-signed CA certificates.
- Must include one or more currently valid CA certificates issued to the issuer of the certificate, which may be used to verify the signature on the certificate.
- Must be an empty certs-only CMS format, if no currently valid CA certificates can be included.

Alternatively, the HTTP URI may return a single DER encoded certificate that has an extension of “.cer” [RFC 2585] and must include “Content-Type: application/pkix-cert” in the HTTP response headers. The use of this option is discouraged because it does not permit zero or multiple CA certificates, thereby reducing flexibility.

An LDAP URI may be included in the authorityInfoAccess extension, id-ad-caIssuers access method, that specifies either or both the cACertificate and crossCertificatePair attributes. A CA may, alternatively, specify each of the attributes in a separate LDAP URI.

The authoritative OCSP [RFC 6960] service must be specified in the authorityInfoAccess extension, id-ad-ocsp access method, of each Subscriber certificate and the scheme portion of the URI must be "http". This HTTP response must include “Content-Type: application/ocsp-response” in the HTTP response headers.

6.3. Subject Information Access Extension

This section includes requirements in addition to those specified in Section 2.2.1. in [COMMON].

The subjectInfoAccess extension must appear in CA certificates, unless the CA certificate asserts a path length constraint of zero in the Basic Constraints extension.

When present, the subjectInfoAccess extension must contain at least one instance of the id-ad-caRepository access method containing a publicly accessible HTTP URI which returns a certs-only Cryptographic Message [RFC 8551]. This message:

- Must contain a binary (DER encoded) file with an extension of ".p7c"
- Must include “Content-Type: application/pkcs7-mime” must be included in the HTTP response headers.
- Must contain all currently valid CA certificates issued by the subject of this certificate, except self-signed certificates
- Must be an empty certs-only CMS format, if no currently valid CA certificates can be included.

An LDAP URI may be included in the subjectInfoAccess extension, id-ad-caRepository access method. If present, the LDAP URI must include the DN of the entry containing the relevant certificates and specify the directory attribute in which the certificates are located.

6.4. Extended Key Usage (EKU)

anyExtendedKeyUsage is prohibited in all certificates.

Applicable EKUs may be added to certificate profiles based on the usage of the private

key associated with the public key certificate. However, the EKUs should be added with caution since they imply privileges and capabilities to relying party systems. The following is a list of EKU OIDs that shall not be included in end entity certificates issued to humans, roles, or groups:

- OCSP Signing,
- Time Stamp,
- PIV card auth,
- PIV content signing,
- PIVI Content Signing,
- id-pkinit-KPKdc.

The above EKU OIDs can be included in NPE certificates to specifically convey the indicated capability

7. Profile Worksheets

The profile worksheets identify the mandatory and optional extensions of certificates and CRLs. Unless otherwise stated, all fields and extensions listed are mandatory. Certificate extensions defined in [RFC 5280] that are not specified as mandatory or optional in the profile worksheets must not be included.
